

Olist E-Commerce Performance Dashboard

Business Insights & Recommendations

Insights derived from the Power BI dashboard and available Olist dataset

Analysis Period: September 2016 – August 2018

This document summarizes the main business insights identified from the dashboard and translates them into practical recommendations. The analysis is based on the available historical observation period, so recent-period changes are treated as signals rather than permanent trends.

Dashboard Pages Covered

Executive • Sales • Customer • Seller • Products • Logistics • Payments • Geography

Table of Contents

1. Executive Summary
2. Key Findings
3. Sales Insights
4. Customer Insights
5. Seller Insights
6. Product Insights
7. Logistics Insights
8. Payment Insights
9. Geography Insights
10. Business Recommendations / Solutions
11. Conclusion

1. Executive Summary

The Olist E-Commerce Performance Dashboard provides an overview of sales, customers, sellers, products, logistics, payments and geography across the available observation period from September 2016 to August 2018. The dashboard shows a business with strong overall order and sales activity, but also highlights areas where operational efficiency and customer value can be improved.

The most important findings are the low level of observed repeat purchasing, the recent increase in late deliveries, and the recent mismatch between order growth and sales growth. At the same time, freight cost represents a meaningful share of sales, sales are geographically concentrated, and seller-level delivery performance varies considerably.

Overall direction: the main opportunity is not only to generate more orders, but to improve the value and quality of existing demand through better customer retention, seller performance management, logistics control, freight efficiency and AOV improvement.

Key dashboard metrics

Metric	Value	Description
Gross Sales	R\$13.6M	Overall gross sales.
Total Orders	99.4K	Total observed orders.
Total Customers	96.1K	Total observed customers.
Average Order Value	R\$136.7	Average order value.
Average Review Score	4.1	Overall review score.

Average Delivery Days	12	Average delivery time.
-----------------------	----	------------------------

2. Key Findings

Strong overall marketplace activity

The dashboard records R\$13.6M in gross sales and 99.4K orders across the observation period.

Low observed repeat purchasing

93.1K customers (96.88%) are shown as single-order customers, while 3.0K (3.12%) are repeat customers. This should be interpreted within the fixed dataset window.

Recent revenue-per-order pressure

The latest monthly comparison shows orders increasing by 3.5% while gross sales decreased by 4.56%, indicating a recent decline in revenue generated per order.

Recent logistics warning

The latest monthly late-delivery rate is 10.39%, compared with 4.48% in the previous month.

Seller performance varies

The high-risk seller table includes sellers with materially higher late-delivery rates, with the highest displayed example at 22.96%.

Freight is significant

Freight cost is R\$2.3M, representing 16.6% of sales.

Geographic concentration

São Paulo is the largest sales market at approximately R\$5.2M, followed by Rio de Janeiro and Minas Gerais.

Credit card is dominant

Credit card represents approximately 76.94% of the displayed payment method distribution, with 51.5% installment usage.

3. Sales Insights

Gross sales reach R\$13.6M, with the overall monthly trend showing strong growth from the beginning of the observation period into 2017 and 2018. The dashboard also shows R\$13.2M in delivered sales and a delivered-sales rate of 97.3%.

Recent sales performance

The latest monthly comparison is one of the most useful signals in the dashboard. Monthly orders increased from 6,292 to 6,512 (+3.5%), while monthly gross sales decreased from R\$0.90M to R\$0.85M (-4.56%). This suggests that the business is receiving more orders but generating less revenue per order in the latest comparison.

Interpretation: this is a recent-period signal rather than proof of a permanent AOV decline. The next step is to identify whether the change is caused by product mix, category mix, seller mix, geography or customer behavior.

Category performance

Health Beauty is the leading category at approximately R\$1.26M in sales, followed by Watches Gifts (R\$1.21M), Bed Bath Table (R\$1.04M), Sports Leisure (R\$0.99M) and Computers Accessories (R\$0.91M).

Recommended sales analysis

- Break down recent AOV movement by category, product, seller, geography and customer type.
- Identify high-sales categories with low AOV for bundling and cross-selling opportunities.
- Compare matched periods for YoY analysis, such as January–August 2018 versus January–August 2017.
- Avoid treating September 2018 partial-period values as a normal full month.

4. Customer Insights

The dashboard shows 96.1K customers. Of these, 93.1K (96.88%) are classified as single-order customers and 3.0K (3.12%) as repeat customers.

This indicates a clear opportunity to increase repeat purchasing. However, because the dataset ends in August 2018, the 3.12% figure should be described as the observed repeat-customer rate within the available data window, rather than a definitive long-term retention rate.

Customer opportunity

- Measure time to second purchase using customer cohorts.
- Compare 30-, 60-, 90- and 180-day repeat purchase behavior where the observation window allows it.
- Identify whether repeat purchasing differs by category, geography, AOV or first-purchase characteristics.
- Segment customers into one-time, repeat, high-value and potentially at-risk groups.
- Use product and category affinity to support cross-selling and second-purchase campaigns.

5. Seller Insights

The dashboard contains 3,095 sellers, with R\$13.6M in seller sales, an average seller AOV of R\$137.8 and an overall delivery rate of approximately 97%.

The High Risk Sellers table combines order volume, sales, delivery rate and late-delivery rate. For example, seller 1931 has 392 orders, R\$36.4K in sales, a 99.23% delivery rate and a 22.96% late-delivery rate.

Seller management opportunity

- Prioritize sellers using both late-delivery rate and business impact, rather than late rate alone.
- Create a seller risk score using order volume, sales, delivery rate, late-delivery rate and review performance.
- Separate high-volume/high-risk sellers from low-volume/high-risk sellers.
- Investigate whether seller performance is concentrated in specific states, categories or products.

6. Product Insights

The Products page allows individual products to be examined through sales, orders, AOV and adjusted-sales views. The selected product example shows R\$63.9K in sales, 187 orders and an AOV of R\$341.6.

The main improvement area is business usability. Product IDs are useful for technical traceability but are difficult for business users to interpret on their own.

Recommended product analysis

- Display product name or description where available, alongside Product ID.
- Combine sales, orders, AOV, review score, delivery rate, late-delivery rate and freight cost.
- Identify products with high sales but poor delivery performance.
- Identify high-AOV products that could support premium or cross-sell strategies.
- Use product-category relationships to understand whether product performance is driven by the wider category.

7. Logistics Insights

Overall logistics performance is relatively strong: the dashboard shows a 97% delivery rate, 12 average delivery days, an 8.1% late-delivery rate and 9 average late-delivery days.

The delivery split shows approximately 89K early-delivery orders (91.89%) and 8K late-delivery orders (8.11%).

The main warning is the latest monthly comparison, where the late-delivery rate increased from 4.48% to 10.39%. This is a significant recent-period deterioration and should be investigated before assuming that it represents a permanent trend.

Logistics solution

- Analyze late deliveries by seller, customer state, product category, product and month.

- Combine late-delivery rate with order volume and sales to identify operational priorities.
- Investigate whether high freight-cost orders are also more likely to be late.
- Track average late days in addition to the percentage of late orders.

8. Payment Insights

The Payments page shows 99.44K payment orders, R\$16.01M in payment value, an average of 2.9 installments and 51.5% installment usage.

Credit card is the dominant payment method at approximately 76.94%, followed by boleto at 19.90%.

The difference between payment value and gross sales should be clearly documented in the final project because payment-level records can differ from order-level sales totals.

Recommended payment analysis

- Compare AOV across payment methods.
- Analyze AOV and sales by installment count.
- Measure payment method behavior by category and customer type.
- Investigate whether installment usage is associated with higher-value orders or repeat purchasing.

9. Geography Insights

Geographically, São Paulo is the largest market with approximately R\$5.2M in sales, followed by Rio de Janeiro at R\$1.8M and Minas Gerais at R\$1.6M. The dashboard therefore shows a strong concentration of sales in the southeastern region of Brazil.

This concentration can be viewed both as a strength, because it indicates strong market penetration, and as a concentration risk because a large share of sales depends on a relatively small number of states.

Recommended geographic analysis

- Compare state-level sales with customer count and AOV.
- Identify states with lower sales but growing customer activity.
- Combine geography with freight cost and delivery performance.
- Prioritize expansion opportunities where demand potential and logistics feasibility are both favorable.

10. Business Recommendations / Solutions

The recommendations below are based on the findings visible in the dashboard. They are intended as decision-support directions rather than claims that a particular intervention will definitely produce a specific result.

1. Customer Lifecycle & Repeat-Purchase Strategy

Focus on increasing the number of customers who make a second purchase. Build cohort analysis, identify the typical time to second purchase, and use category/product affinity for targeted cross-selling, bundles and second-purchase incentives.

Primary KPIs: Observed repeat-purchase rate, second-purchase rate, time to second purchase, customer AOV.

2. Seller Risk Management

Create a seller risk score combining late-delivery rate with order volume, sales contribution, delivery rate and customer feedback. High-volume/high-risk sellers should receive priority attention.

Primary KPIs: Seller late-delivery rate, delivery rate, risk score, affected orders and sales.

3. Logistics Optimization

Investigate the recent increase in late deliveries by seller, geography, category and product. Focus operational actions on the combinations that affect the greatest number of orders or greatest sales value.

Primary KPIs: Late-delivery rate, average late days, delivery rate, affected sales.

4. AOV Improvement

Investigate the recent situation where order volume increased while sales declined. If product or category mix is confirmed as the driver, use bundles, cross-selling and targeted product recommendations to increase order value.

Primary KPIs: AOV, sales per customer, category mix and high-value order share.

5. Freight Efficiency

Analyze freight cost as a percentage of sales by state, seller, category and order value. Prioritize high-freight combinations where delivery performance is also weak.

Primary KPIs: Freight cost, freight cost % of sales, freight per order and late-delivery rate.

6. Geographic Expansion

Use state-level sales, customers, AOV, freight and delivery performance together to identify markets with potential for growth without creating disproportionate logistics costs.

Primary KPIs: State sales, customers, AOV, freight cost % and delivery rate.

Recommended decision framework

The dashboard can be extended from descriptive reporting into a decision-support process:

Identify → Diagnose → Prioritize → Act → Monitor

For example, a seller with a high late-delivery rate should not automatically be treated as the highest priority. The impact should be evaluated using order volume and sales. The same approach can be applied to products, categories and states.

11. Conclusion

The Olist E-Commerce Performance Dashboard provides a consolidated view of the marketplace and highlights both business strengths and improvement opportunities. The overall business shows strong order and sales activity, broad geographic coverage and a large seller and customer base.

At the same time, the analysis points to three areas that deserve the highest attention: low observed repeat purchasing, recent logistics deterioration and recent pressure on revenue per order. Freight cost, seller risk and geographic concentration provide additional areas for operational and strategic analysis.

The recommended approach is therefore to move beyond simply monitoring KPIs and use the dashboard to identify where performance is changing, understand the drivers behind those changes and prioritize actions based on business impact.

Important analytical limitation: all findings are constrained by the available observation period of September 2016 to August 2018. Recent-period movements should be treated as signals, and customer retention conclusions should account for the limited follow-up window near the end of the dataset.

Overall, the dashboard can support a practical BI decision framework focused on customer value, revenue efficiency, seller performance, logistics reliability, cost control and geographic growth.

Project positioning: This analysis positions the Olist dashboard as a decision-support Business Intelligence solution rather than only a KPI reporting dashboard.
